

Tank Inspection Copilot

Mobile-first inspection workflow for geometry-aware defect capture across the shell, roof, and annular ring. Inspectors can locate findings on course-by-plate shell maps, polar roof sectors, and 10 degree annular zones before evidence, QA, and export.

Shell

unwrapped courses, plates, seam offsets, azimuth, and elevation

Roof

polar sectors and rings from apex to outer edge

Annular

circumferential band zones at the floor-to-shell junction

Shell: course and plate map

Define course count, plate width, seam origin, and offset rules, then capture defects by course, plate, azimuth, elevation, and weld context.

Roof: polar inspection grid

Split the roof into angular sectors and radial rings so every finding has a repeatable sector, ring, azimuth range, and zone identifier.

Annular ring: edge-band focus

Capture the critical annular inspection band as 36 ten-degree zones around the floor edge, aligned to the same tank orientation reference.

Evidence and validation

Each defect links type, severity, measurements, notes, photos, surface position, QA warnings, and report-ready JSON/CSV export.
